October 17, 2018

Plan

- 1. Arrow, Sen, Muller-Satterthwaite
- Characterizing Voting Methods: Majority (May, Asan & Sanver), Scoring Rules (Young), Borda Count (Farkas and Nitzan, Saari), Approval Voting (Fishburn)
- 3. Voting to get things "right" (Distance-based measures, Condorcet and extensions)
- 4. Strategizing (Gibbard-Satterthwaite)
- Generalizations
 - 5.1 Infinite Populations
 - 5.2 Judgement aggregation (List & Dietrich)
- 6. Logics
- 7. Applications

Muller-Satterthewaite

Linear Preferences: $\mathcal{L} = \{ > \mid < \subseteq X \times X \text{ is a linear order} \}$

Social choice function: $C: \mathcal{L}^n \to X$

(weak) Pareto: C satisfies weak unanimity provided if for every preference profile $> \in \mathcal{L}^n$, if there is a pair of alternatives x and y such that $x >_i y$ for all $i \in N$, then $C(>) \neq y$.

Monotonicity: C is monotonic provided if for every preference profile $> \in \mathcal{L}^n$ such that C(>) = x, if >' is another profile such that $x >_i' y$ whenever $x >_i y$ for every agent i and alternative y, then C(>') = x.

Dictator: A voter i is a dictator in a social choice function C if C always selects is top choice: for every preference profile >, C(>) = a iff for all $y \in X$ different from x, $x >_i y$.

A coalition S is winning if, for any profile \mathbf{P} in which for all $i \in S$, there is some a such that $i \in \mathbf{P}(a, y)$ for some a and all y, $F(\mathbf{P}) = a$.

A coalition S is *blocking* if there exist some profile \mathbf{P} such that $F(\mathbf{P}) = a$ and a is ranked on the top by all the voters in S and ranked on the bottom by all the voters in $V \setminus S$.

Lemma. Assuming Mon and P, a coalition S is blocking iff it is winning.

M-S Theorem. If $|X| \ge 3$ and C is Mon and P, then C is a dictator.

If *S* is blocking then *S* is winning.

Claim: For any **P** with b at the top for each $i \in S$, we have $F(\mathbf{P}) = b$

If C(>) = b, then we are done

If *S* is blocking then *S* is winning.

If
$$C(>) = b$$
, then we are done

$$C(>) \neq a$$

If S is blocking then S is winning.

If
$$C(>) = b$$
, then we are done

$$C(>) \neq a$$

$$C(>) \stackrel{?}{=} c$$
 for $c \notin \{a, b\}$

If S is blocking then S is winning.

$$b \cdots b c \cdots c$$
 $c \vdots c \vdots \vdots$
 $a \cdots a b \cdots b$

If
$$C(>) = b$$
, then we are done

$$C(>) \neq a$$

$$C(>') = c \text{ for } c \notin \{a, b\}$$

$$C(>') = c \text{ for } c \notin \{a, b\}$$

 $C(>'') \neq a$

$$C(>') = c \text{ for } c \notin \{a, b\}$$

 $C(>'') \neq a, C(>'') \neq b,$

$$C(>')=c$$
 for $c \notin \{a,b\}$
$$C(>'') \neq a, C(>'') \neq b, C(>'') \neq d \text{ with } d \notin \{a,b,c\},$$

$$C(>')=c$$
 for $c \notin \{a,b\}$
$$C(>'') \neq a, \ C(>'') \neq b, \ C(>'') \neq d \text{ with } d \notin \{a,b,c\},$$

$$C(>'')=c$$

$$C(>') = c$$
 for $c \notin \{a, b\}$
 $C(>'') \neq a$, $C(>'') \neq b$, $C(>'') \neq d$ with $d \notin \{a, b, c\}$,
 $C(>'') = c$ implies $C(>''') = c$, contradicts S is blocking.

If *S* is blocking then *S* is winning.

$$b \cdots b c \cdots c$$
 $c \vdots c \vdots \vdots$
 $a \cdots a b \cdots b$

If
$$C(>) = b$$
, then we are done

$$C(>) \neq a$$

$$C(>) \neq c \text{ for } c \notin \{a, b\}$$

Suppose that S is a **minimal** winning coalition.

Claim: if there exists $S_1 \neq \emptyset$ and $S_2 \neq \emptyset$ such that $S = S_1 \cup S_2$, then contradiction.

Then |S| = 1.

$$C(>) \neq c$$
 (o.w. contradicts S is winning)

$$C(>) \neq d$$
 with $d \notin \{a, b, c\}$ (o.w. contradicts S is winning)

$$C(>) \neq c$$

$$C(>) \neq d$$
 with $d \notin \{a, b, c\}$

$$C(>) \stackrel{?}{=} a$$

$$C(>) = a$$

$$C(>') = a$$

$$C(>) = a$$

$$C(>') = a$$
, $C(>'') = a$, so $S_1 \cup T$ is blocking hence winning

$$C(>)=a, C(>')=a, \ C(>'')=a, \ so \ S_1\cup T$$
 is winning

$$C(>''') \neq a$$

$$C(>)=a, C(>')=a, \ C(>'')=a, \ so \ S_1\cup T$$
 is winning

$$C(>''') \neq a$$
, $C(>''') \neq b$

$$C(\gt) = a, C(\gt') = a, C(\gt'') = a, \text{ so } S_1 \cup T \text{ is winning}$$

$$C(>''') \neq a$$
, $C(>''') \neq b$, $C(>''') \neq c$

$$C(>)=a, C(>')=a, \ C(>'')=a, \ so \ S_1\cup T$$
 is winning

$$C(>''') \neq a, \ C(>''') \neq b, \ C(>''') \neq c, \ C(>''') \neq d \notin \{a,b,c\}$$

$$C(>) \neq c$$

$$C(>) \neq d$$
 with $d \notin \{a, b, c\}$

$$C(>) \neq a$$

$$C(>) \neq c$$

$$C(>) \neq d$$
 with $d \notin \{a, b, c\}$

$$C(>) \neq a$$

$$C(>) \neq b$$

Tacking Stock

Impossibility results: $|X| \ge 3$, Arrow (social welfare function, IIA, P, UD, Non-Dictator), Sen (Liberalism, Pareto), Muller-Satterthwaite (social choice function, Mon, P, Non-Dictator)

Phenomena: Monotonicity, Condorcet vs. Borda (cancellation), Multiple-districts paradox

B would win both districts!

Characterizing Majority Rule

If there are only **two** options, then majority voting is the "best" procedure:

Characterizing Majority Rule

If there are only **two** options, then majority voting is the "best" procedure: Choosing the outcome with the most votes (allowing for ties) is the *only* group decision method satisfying the previous properties.

K. May. A Set of Independent Necessary and Sufficient Conditions for Simple Majority Decision. Econometrica, Vol. 20 (1952).

Suppose there are only two candidates A and B and n voters (let $N = \{1, ..., n\}$ be the set of voters).

Then the voters' preferences can be represented by elements of $\{-1,0,1\}$ (where 1 means A is preferred to B, -1 means B is preferred to A and B).

A **social decision method** is a function $F: \{-1, 0, 1\}^n \rightarrow \{-1, 0, 1\}.$

- ▶ **Unanimity**: unanimously supported alternatives must be the social outcome.
- ► **Anonymity**: all voters should be treated equally.

- Neutrality: all candidates should be treated equally.
- ▶ **Pos. response**: unidirectional shift in voters' opinions should not harm the alternative toward which this shift occurs

▶ **Unanimity**: unanimously supported alternatives must be the social outcome.

If for all
$$i \in N$$
, $v_i = x$ then $F(v) = x$ (for $x \in \{-1, 0, 1\}$).

▶ Anonymity: all voters should be treated equally.

- Neutrality: all candidates should be treated equally.
- ▶ **Pos. response**: unidirectional shift in voters' opinions should not harm the alternative toward which this shift occurs

▶ **Unanimity**: unanimously supported alternatives must be the social outcome.

If for all
$$i \in N$$
, $v_i = x$ then $F(v) = x$ (for $x \in \{-1, 0, 1\}$).

- ► **Anonymity**: all voters should be treated equally.
 - $F(v_1, v_2, \dots, v_n) = F(v_{\pi(1)}, v_{\pi(2)}, \dots, v_{\pi(n)})$ where π is a permutation of the voters.
- Neutrality: all candidates should be treated equally.
- ▶ **Pos. response**: unidirectional shift in voters' opinions should not harm the alternative toward which this shift occurs

▶ **Unanimity**: unanimously supported alternatives must be the social outcome.

If for all
$$i \in N$$
, $v_i = x$ then $F(v) = x$ (for $x \in \{-1, 0, 1\}$).

Anonymity: all voters should be treated equally.

$$F(v_1, v_2, \dots, v_n) = F(v_{\pi(1)}, v_{\pi(2)}, \dots, v_{\pi(n)})$$
 where π is a permutation of the voters.

Neutrality: all candidates should be treated equally.

$$F(-v) = -F(v)$$
 where $-v = (-v_1, \dots, -v_n)$.

▶ **Pos. response**: unidirectional shift in voters' opinions should not harm the alternative toward which this shift occurs

Unanimity: unanimously supported alternatives must be the social outcome.

If for all
$$i \in N$$
, $v_i = x$ then $F(v) = x$ (for $x \in \{-1, 0, 1\}$).

- ► **Anonymity**: all voters should be treated equally.
 - $F(v_1, v_2, \dots, v_n) = F(v_{\pi(1)}, v_{\pi(2)}, \dots, v_{\pi(n)})$ where π is a permutation of the voters.
- Neutrality: all candidates should be treated equally.

$$F(-v) = -F(v)$$
 where $-v = (-v_1, ..., -v_n)$.

▶ **Pos. response**: unidirectional shift in voters' opinions should not harm the alternative toward which this shift occurs

If
$$F(v)=0$$
 or $F(v)=1$ and $v\prec v'$, then $F(v')=1$ (where $v\prec v'$ means for all $i\in N$ $v_i\leq v_i'$ and there is some $i\in N$ with $v_i< v_i'$) then $F(v')=1$.

May's Theorem (1952) A social decision method F satisfies unaniminity, neutrality, anonminity and positive responsiveness iff F is majority rule.

If
$$(1,1,-1)$$
 is assigned 0 or -1 then

▶ Neutrality implies (-1, -1, 1) is assigned 0 or 1

- ▶ Neutrality implies (-1, -1, 1) is assigned 0 or 1
- ▶ Anonymity implies (1, -1, -1) is also assigned 0 or 1

- ▶ Neutrality implies (-1, -1, 1) is assigned 0 or 1
- ▶ Anonymity implies (1, -1, -1) is also assigned 0 or 1
- ▶ Positive Responsiveness implies (1, 0, -1) is assigned 1

- ▶ Neutrality implies (-1, -1, 1) is assigned 0 or 1
- ▶ Anonymity implies (1, -1, -1) is also assigned 0 or 1
- ▶ Positive Responsiveness implies (1, 0, -1) is assigned 1
- ▶ Positive Responsiveness implies (1, 1, -1) is assigned 1, Contradiction.

Other characterizations

Weak path independence: If
$$|F(R_1) - F(R_2)| \neq 2$$
 then $F(R_1 \oplus R_2) = F(F(R_1) \oplus F(R_2)$

G. Asan and R. Sanver. Another Characterization of the Majority Rule. Economics Letters, 75 (3), 409-413, 2002.

E. Maskin. *Majority rule, social welfare functions and game forms.* in *Choice, Welfare and Development,* The Clarendon Press, pgs. 100 - 109, 1995.

G. Woeginger. *A new characterization of the majority rule*. Economic Letters, 81, pgs. 89 - 94, 2003.

Reinforcement: Suppose that X and Y are disjoint sets of voters. Let W_X be the set of winners for X and W_Y the set of winners for Y. If there is at least one candidate that wins both elections, then the winner(s) for the entire population is $W_X \cap W_Y$.

Reinforcement: Suppose that X and Y are disjoint sets of voters. Let W_X be the set of winners for X and W_Y the set of winners for Y. If there is at least one candidate that wins both elections, then the winner(s) for the entire population is $W_X \cap W_Y$.

Continuity: Suppose that a group of voters X elects a candidate A and a disjoint group of voters Y elects a different candidate B. Then there must be some number m such that the population consisting of the subgroup Y together with m copies of X will elect A.

Reinforcement: Suppose that X and Y are disjoint sets of voters. Let W_X be the set of winners for X and W_Y the set of winners for Y. If there is at least one candidate that wins both elections, then the winner(s) for the entire population is $W_X \cap W_Y$.

Continuity: Suppose that a group of voters X elects a candidate A and a disjoint group of voters Y elects a different candidate B. Then there must be some number m such that the population consisting of the subgroup Y together with m copies of X will elect A.

Theorem (Young 1975). A social decision method satisfies anonymity, neutrality, reinforcement and continuity if and only if the method is a scoring rule.

Borda Count

Cancellation: For a profile R, Suppose that $N_{a\ b} = \{i \mid aP_ib\}$. If $N_{a\ b} = N_{b\ a}$ then $aI_{F(R)}b$.

H. P. Young. *An axiomatization of Borda's rule*. Journal of Economic Theory, 9, pgs. 43 - 52, 1974.

S. Nitzan and A. Rubinstein. *A further characterization of Borda ranking method*. Public Choice, 36, pgs. 153 - 158, 1981.

Fact There is no fixed rule that always elects a unique Condorcet winner.

| # voters | 2 | 2 | 1 |
|----------|---|---|---|
| | а | b | С |
| | d | d | а |
| | b | а | b |
| | С | С | d |

Fact There is no fixed rule that always elects a unique Condorcet winner.

The unique Condorcet winner is a.

Fact There is no fixed rule that always elects a unique Condorcet winner.

Vote-for-1 elects $\{a,b\}$, vote-for-2 elects $\{d\}$, vote-for-3 elects $\{a,b\}$.

Fact There is no fixed rule that always elects a unique Condorcet winner.

 $({a}, {b}, {c, a})$ elects a under AV.

Fact Condorcet winners are always AV outcomes, but a Condorcet looser may or may not be an AV outcome.

Fishburn's Theroem

Theorem (Fishburn 1978). A social decision method is approval voting if and only if the method satisfies anonymity, neutrality, reinforcement and the following technical property:

▶ If there are exactly two voters who approve of disjoint sets of candidates, then the methods selects as winners all the candidates chosen by the two voters (i.e., the union of the ballots chosen by the voters).

Distance

"Condorcet begins with the premise that the object of government is to make decisions that are in the best interest of society. This leads naturally to the question: what voting rules are most likely to yield good outcomes?....

Distance

"Condorcet begins with the premise that the object of government is to make decisions that are in the best interest of society. This leads naturally to the question: what voting rules are most likely to yield good outcomes?....

Why should we buy the idea, though, that there really is such a thing as an objectively "best" choice? Aren't values relative, and isn't the point of voting to strike a balance between conflicting opinions, not to determine a correct one?"

H. P. Young. *Optimal Voting Rules*. The Journal of Economic Perspectives, 9:1, pgs. 51 - 64, 1995.

"...in many situations, differences of opinion arise from differences in values, not erroneous judgments. In this case it seems better to adopt the view that group choice is an exercise in finding a compromise between conflicting opinions." (Young, p. 60)

"...in many situations, differences of opinion arise from differences in values, not erroneous judgments. In this case it seems better to adopt the view that group choice is an exercise in finding a compromise between conflicting opinions." (Young, p. 60)

Kemeny metric: Suppose that R and R' are two rankings

d(R, R') = number of pairs of alternatives on which they differ

"...in many situations, differences of opinion arise from differences in values, not erroneous judgments. In this case it seems better to adopt the view that group choice is an exercise in finding a compromise between conflicting opinions." (Young, p. 60)

Kemeny metric: Suppose that R and R' are two rankings

d(R, R') = number of pairs of alternatives on which they differ

Examples:

$$d(a > b > c > d, d > a > b > c) = 3$$

"...in many situations, differences of opinion arise from differences in values, not erroneous judgments. In this case it seems better to adopt the view that group choice is an exercise in finding a compromise between conflicting opinions." (Young, p. 60)

Kemeny metric: Suppose that R and R' are two rankings

d(R, R') = number of pairs of alternatives on which they differ

Examples:

$$d(a > b > c > d, d > a > b > c) = 3$$

$$d(a > b > c > d, c > d > a > b) = 4$$

mean ranking: the ordering that minimizes the sum of squares of distances from a given set of n rankings

median ranking: the ordering that minimizes the sum of distances from the set of n rankings

| # voters | 21 | 5 | 4 | 11 |
|----------|----|---|---|----|

| | В | C | Α | В |
| | C | Α | В | Α |

A > B > C is the median ranking

B > A > C is the mean ranking

S. Nitzan. *Some Measures of Closeness to Unanimity and Their Implications*. Theory and Decision, 13, 129 - 138, 1981.

Let $P = (P_1, \dots, P_n)$ be a sequence of linear orders on X.

Let $P = (P_1, \dots, P_n)$ be a sequence of linear orders on X.

$$x \in X$$
, let $U(x) = \{P \in \mathcal{P}^n \mid x = top(P_i) \text{ for all } i\}$

Let $P = (P_1, \dots, P_n)$ be a sequence of linear orders on X.

$$x \in X$$
, let $U(x) = \{P \in \mathcal{P}^n \mid x = top(P_i) \text{ for all } i\}$

 $P \in U(x)$, then it is unanimous that x should be the winner.

Let $P = (P_1, \dots, P_n)$ be a sequence of linear orders on X.

$$x \in X$$
, let $U(x) = \{P \in \mathcal{P}^n \mid x = top(P_i) \text{ for all } i\}$

 $P \in U(x)$, then it is unanimous that x should be the winner.

x is a **relative unanimous winner** provided the *distance* between P and U(x) is no larger than the distance between P and U(y) for all other alternatives y.

$$\delta(P_i, Q_i) = \frac{1}{2} |\{(x, y) \in X \times X \mid \text{the relative ranking of } (x, y) \text{ in } P_i \\ \text{differs from the relative ranking in } Q_i\}|$$

$$\delta(P_i,Q_i) = \frac{1}{2}|\{(x,y) \in X \times X \mid \text{the relative ranking of } (x,y) \text{ in } P_i \\ \text{differs from the relative ranking in } Q_i\}|$$

$$d(P,Q) = \sum_{i=1}^{n} \delta(P_i, Q_i)$$

$$\delta(P_i,Q_i) = \frac{1}{2} |\{(x,y) \in X \times X \mid \text{the relative ranking of } (x,y) \text{ in } P_i \\ \text{differs from the relative ranking in } Q_i\}|$$

$$d(P,Q) = \sum_{i=1}^{n} \delta(P_i, Q_i)$$

$$d(P, Y) = \min_{Q \in Y} d(P, Q)$$

$$\delta(P_i,Q_i) = \frac{1}{2} |\{(x,y) \in X \times X \mid \text{the relative ranking of } (x,y) \text{ in } P_i \\ \text{differs from the relative ranking in } Q_i\}|$$

$$d(P,Q) = \sum_{i=1}^{n} \delta(P_i, Q_i)$$

$$d(P, Y) = \min_{Q \in Y} d(P, Q)$$

$$U^*(x) = \{ P \in \mathcal{P}^n \mid d(P, U(x)) \le d(P, U(y)) \text{ for all } x \in X \}$$

Fact. An alternative \boldsymbol{x} has the highest Borda score iff it is a relative unanimous winner.

$$\delta_2(P_i, Q_i) = \begin{cases} 0 & \text{if } top(P_i) = top(Q_i) \\ 1 & \text{otherwise} \end{cases}$$

Fact An alternative is the plurality winner iff it is closest to the unanimous profile using the δ_2 measure.

It has long been noted that a voter can achieve a preferred election outcome by misrepresenting his or her actual preferences.

It has long been noted that a voter can achieve a preferred election outcome by misrepresenting his or her actual preferences.

C.L. Dodgson refers to a voters tendency to "adopt a principle of voting which makes it a game of skill than a real test of the wishes of the elector."

It has long been noted that a voter can achieve a preferred election outcome by misrepresenting his or her actual preferences.

C.L. Dodgson refers to a voters tendency to

"adopt a principle of voting which makes it a game of skill than a real test of the wishes of the elector."

and that in his opinion

"it would be better for elections to be decided according to the wishes of the majority than of those who happen to be more skilled at the game."

Two Issues

Two Issues

- 1. What does it *mean* to vote strategically?
 - Voting as a game vs. voting as an act of communication

K. Dowding and M. van Hees. *In Praise of Manipulation*. British Journal of Political Science, 38: pp 1-15, 2008.

Two Issues

- 1. What does it *mean* to vote strategically?
 - Voting as a game vs. voting as an act of communication
 - K. Dowding and M. van Hees. *In Praise of Manipulation*. British Journal of Political Science, 38: pp 1-15, 2008.

- 2. The decision to strategize depends on the agents' *information* (eg. poll information).
- S. Chopra, E. Pacuit and R. Parikh. *Knowledge-theoretic Properties of Strategic Voting*. JELIA 2004.

Strategizing Functions

Fix the voters' true preferences: $\mathcal{P}^* = (P_1^*, \dots, P_n^*)$

Given a vote profile \vec{v} of actual votes, we ask whether voter i will change its vote if given another chance to vote.

The following example is due to [Brams & Fishburn]

$$P_A^* = o_1 > o_3 > o_2$$

 $P_B^* = o_2 > o_3 > o_1$
 $P_C^* = o_3 > o_1 > o_2$

| Siz | ze | Group | I | П |
|-----|----|-------|-----------------------|-------|
| 4 | | Α | o ₁ | o_1 |
| 3 | | В | 02 | 02 |
| 2 | | С | 03 | 01 |

- 1. o' is one of the top two candidates as indicated by a poll
- 2. o' is preferred to the other top candidate

The following example is due to [Brams & Fishburn]

$$P_A^* = o_1 > o_3 > o_2$$

 $P_B^* = o_2 > o_3 > o_1$
 $P_C^* = o_3 > o_1 > o_2$

| Si | ze | Group | roup I | |
|----|----|-------|----------------|-----------------------|
| 4 | 1 | Α | \mathbf{o}_1 | o ₁ |
| 3 | 3 | В | 02 | 02 |
| 2 | 2 | C | 03 | 01 |

- 1. o' is one of the top two candidates as indicated by a poll
- 2. o' is preferred to the other top candidate

$$P_A^* = (o_1, o_4, o_2, o_3)$$

$$P_B^* = (o_2, o_1, o_3, o_4)$$

$$P_C^* = (o_3, o_2, o_4, o_1)$$

$$P_D^* = (o_4, o_1, o_2, o_3)$$

$$P_E^* = (o_3, o_1, o_2, o_4)$$

| Size | Group | I | П | Ш | IV |
|------|-------|----|----|-------|-----------------------|
| 40 | Α | 01 | 01 | 04 | o ₁ |
| 30 | В | 02 | 02 | 02 | 02 |
| 15 | С | 03 | 02 | 02 | 02 |
| 8 | D | 04 | 04 | 01 | 04 |
| 7 | Ε | 03 | 03 | o_1 | o ₁ |

- 1. i prefers o' to o, and
- 2. the current total for o' plus agent i's votes for o' is greater than the current total for o.

$$P_A^* = (o_1, o_4, o_2, o_3)$$

$$P_B^* = (o_2, o_1, o_3, o_4)$$

$$P_C^* = (o_3, o_2, o_4, o_1)$$

$$P_D^* = (o_4, o_1, o_2, o_3)$$

$$P_E^* = (o_3, o_1, o_2, o_4)$$

Summary

Agents, knowing an aggregation function, will strategize if they know

- a. enough about other agents' preferences and
- b. that the output of the aggregation function of a changed preference will provide them with a more favorable result.

The Gibbard-Satterthwaite Theorem

A social choice function is **strategy-proof** if for no individual i there exists a profile \vec{R} and a linear order R'_i such that $C(\vec{R}_{-i}, R'_i)$ is ranked above $F(\vec{R})$ according to i.

Theorem. Any social choice function for three or more alternatives that is Pareto and strategy-proof must be a dictatorship.
